

OREGON

AGRICULTURAL

STATISTICS

FOREWORD

This is the first annual publication of Oregon Agricultural Statistics. It was prepared because of the many requests received from the farming, ranching and agri-business communities for a statistical summary of Oregon agriculture. The data will be used to show the importance and variety of Oregon agriculture. It will help promote the sale of Oregon agricultural products both domestically and overseas; guide farm related businesses in supplying the services needed and assist producers in making production and marketing decisions.

Reliable facts are an important tool that the agricultural community can use to help them operate more effectively and efficiently. Oregon Agricultural Statistics was designed to bring these facts into one convenient publication.

The data was compiled by the Oregon Crop and Livestock Reporting Service and published by the Oregon Department of Agriculture. We wish to thank the Oregon State University Extension Service and their County Agents for supplying much of the county data.

The estimates in this publication are based primarily on data provided by Oregon's farmers, ranchers and other agricultural businesses. I want to extend special thanks to these many voluntary reporters who gave unselfishly of their time and effort. Without their cooperation and assistance this publication would not be possible.

Sincerely,

Paul M. Williamson

Paul M. Williamson
Statistician in Charge

1/ Jan. 1, 1982 Inventory.
 2/ Dec. 1, 1981 Inventory.

GENERAL

The value of all 1981 agricultural commodities produced in Oregon, at \$1.90 billion, fell 2 percent below the 1980 record high of \$1.93 billion. Grain, forage, and miscellaneous field crops was the major category leading to the 1981 reduction. This was the second straight year that all principal crop values exceeded the \$1 billion mark. Major crops continue to make up the largest portion of the State's total agricultural value, accounting for 55 percent of the total, a drop from 57 percent of the total value in 1980.

Oregon's importance to the national agricultural production cannot be overlooked as the State ranks first in the Nation for 15 major commodities, led by all Ryegrass seed and Kentucky Bluegrass seed. Oregon ranks second among the top producing states for 8 other commodities led by onions and processing snap beans. There are 15 additional commodities for which Oregon ranks in the top 10 producing states.

1/ Value based on net value of sales: gross value less cost of plant materials purchased from other growers for growing on.

SEASON REVIEW - 1981

The year started off as one of the warmest and driest Januarys on record. Winter wheat was in good to excellent shape as growers took advantage of the dry weather to get some spraying completed. February started out cold and dry, but this soon ended as heavy rains during the third week caused high water and local flooding across the northwest and northeast sections of the state. Most other sections received below normal rainfall. Snow pack in the mountains was at all-time record lows. Most February farm activities consisted of pruning, spraying and care of livestock.

The first half of March was a continuation of the warm, dry weather that prevailed most of the winter. Winter wheat in the western portion of the state continued to show more and more signs of disease and weed problems. Planting of green peas, onions, and early potatoes got underway as early fruits were beginning to bloom. During the second half of the month most all areas received some precipitation. Precipitation was still below normal for western Oregon, although many areas east of the Cascades received above normal rainfall amounts.

April was a typical spring month for the Pacific Northwest. Fruit crops continued to bloom, although weather conditions were not the best for pollination. The weather for May was cloudy and wet with few temperature extremes. Most areas received from 120 percent to more than 150 percent of normal rainfall, except southeastern Oregon, where more than 200 percent of normal precipitation fell. Fruit sets ranged from good to poor. Disease problems continued to cause concern for Willamette Valley wheat and grass seed growers. Heavy rains the first three weeks in June hampered strawberry harvest. The rain caused heavy splitting of sweet cherries in many areas. By the end of the month raspberry and blueberry harvest was underway.

July started out wet, but the rains stopped by the end of the first week as wheat and barley harvest got underway. Green pea harvest was winding down as snap bean harvest was getting started. Early tree fruit harvest also got underway. August was generally hot and dry, with most areas of western Oregon reporting all-time highs. Rainfall was non-existent or very light. Grain, hay, and mint harvest continued. Onion and potato harvest got off to a good start with excellent harvesting weather. Processing vegetable harvest was in full swing as the hot temperatures hastened crop maturity. September remained hot and dry the first half of the month with cooler temperatures and above normal rainfall prevailing the last half. Production of Evergreen blackberries was excellent, but many were left in the fields due to depressed market prices. Wheat harvest was winding down in the higher elevations as seeding of the 1982 crop got underway. Filberts were beginning to drop, and final summer cannery crops were being picked.

Precipitation during October was above normal west of the Cascades and in the far eastern areas. Winter wheat seeding continued with some replanting necessary as a result of crusting. Pear and apple harvest continued as filbert and cranberry harvest started. Potato harvest was mostly completed by the end of the month. Temperatures and precipitation during November ranged mostly above normal in all areas. Most wheat seedings were completed by the end of the month with a good emergence. Final harvesting of many crops was completed. December ended the year with stormy and wet weather. Precipitation was above, to much above, normal with widespread flooding throughout the month. Substantial snows in the Cascades got the 1982 snowpack off to a good start.

FIELD CROPS

Winter grains were seeded during mostly adequate moisture conditions throughout the state except for some western areas which were short of moisture for the early seedings. Adequate to surplus moisture was received throughout the winter months in most areas of the state. Temperature readings held above normal during the winter, giving rise to problems with weeds, disease and insects. Rains continued to benefit eastern Oregon crops, while above-normal precipitation and cool weather through June in the Willamette Valley increased rust and root rot problems. In contrast, near-drought conditions existed in southwest Oregon until June. Spring seedings proceeded well in eastern Oregon under good moisture conditions; however, western Oregon seedings advanced as weather permitted. Harvesting began around July 1 in some early barley fields, and continued through most of the harvest season with few interruptions.

Wheat: Record yields for both winter and spring wheat pushed all wheat production to a near-record crop. Oregon produces less than 3 percent of the total U.S. wheat production but about 21 percent of the white wheat production.

Barley: Second highest yield on record and largest production in nine years.

Oats: Record yield but far below the record production of 12,388,000 in 1943.

Corn: Large increase in corn harvested for grain and record yields of corn for grain and corn for silage.

Sugar beets: Record yields and larger acreage.

Potatoes: Oregon was fourth largest producer in U.S.; yields down slightly.

Hay: Second largest crop produced; average value per ton the lowest in three years.

Hops: Largest harvested acreage and production since 1952.

Mint: Peppermint acreage harvest lowest in seven years and average price per pound was the lowest in eight years. Oregon produces over half of the U.S. peppermint crop.

VALUE OF PRODUCTION: PERCENT OF TOTAL, BY FIELD CROPS, OREGON, 1981

VALUE BASED ON 1980 PRICES

MAJOR FIELD CROPS: Acreage, Production and Value,
Oregon, 1980-81

FRUIT AND NUTS

Despite the record-equalling production of sweet cherries, the utilized crop potential was decreased considerably by late spring rains. The late rains on the nearly mature fruit caused the cherries to split, resulting in abandonment or alternate utilization. This marked the second straight year of above normal loss. The season average price was also higher for utilized cherries, reflecting the smaller crop nationally. Oregon ranked second nationally in sweet cherry production, producing nearly one-fourth of the total production.

Apple production in 1981 was down considerably from the record crop of a year ago. Above normal temperatures in August reduced crop prospects in some areas. Season average price for apples was improved over 1980, partly attributable to the smaller crop in the northwest.

Pears, the leading fruit produced in Oregon, were virtually free of weather problems with a record-equalling production of both Bartletts and winter pears. Oregon ranks third in pear production in the U.S., producing nearly one-fourth of the U.S. total.

Filberts, despite the second largest crop on record, suffered from the effects of both the heat in August and the rains during harvest. Prices received by growers for filberts were the lowest in four years, largely due to record production the past two years and a large world supply. Oregon produces nearly all the domestically grown filberts.

Plum and prune production was above normal in 1981; however, a large quantity of late season prunes were left unharvested due to rain damage and low prices. Season average price for prunes in 1981 was the lowest in four years.

VEGETABLES

Fresh Market and Dual Purpose

Production of fresh market and dual purpose vegetable crops accounted for 34 percent of the total Oregon vegetable production. Most crops showed a reduction in yields as record high temperatures moved into the state in August. As far as national rankings are concerned, Oregon continues in seventh place for production, but eighth in total value.

Processing

Sweet corn was the leading processing crop grown in Oregon in 1981 as planted acreage increased substantially. Planted acreages were down for all other processing vegetable crops. The declines were largely due to large stocks on hand from previous years and poor economic conditions - especially high interest rates and low prices. Oregon continues to rank third in the Nation in total value and fourth in production of processing vegetables, but dropped to fifth in harvested acreage.

SEED CROPS

Seed production in Oregon in 1981 was extremely varied with yields ranging from record highs to record lows. Many Willamette Valley grass seed growers were hit with a number of problems. The mild winter weather allowed diseases to overwinter and the wet spring contributed additional problems. The orchardgrass crop was particularly hard hit, with the fescues and bluegrasses affected to a lesser extent.

Annual ryegrass continued to be the major grass seed crop produced in Oregon, and in 1981 also surpassed perennial ryegrass as the leading value crop. Despite its leading production and value, the 1981 annual ryegrass production was the smallest since 1976, with the fewest acres harvested since 1968. However, preliminary prices indicate a record level and considerably better than the below-the-cost-of-production prices of recent years. Perennial ryegrass slipped to the second leading grass seed in crop value, despite record acreage, record production and an increase in price.

Production of Kentucky bluegrass in 1981 was also a record for Oregon, with the largest harvested acreage since 1968. Preliminary prices for bluegrass, however, indicate that prices are the lowest in five years in Oregon. Record yields for bentgrass in 1981 pushed production above the last two years, but considerably below production levels of the mid-60's to mid-70's. Fescue yields were down from 1980. However, larger acreage for harvest helped offset the decline in yields.

Orchardgrass was particularly hard hit by disease in 1981, with by far the lowest yield on record since estimates began in 1972. Preliminary prices are at a record high level. Both Red and Crimson clover had record yields in Oregon in 1981. However, 28 percent less Red clover acreage harvested held production to only a slight increase over 1980. Increased alfalfa seed yields in Oregon in 1981 brought a nine percent increase in production. Hairy vetch yields in 1981 were better than the poor yields in 1980, but still below average.

BERRIES

Most caneberry growers in Oregon experienced their second economically tight year in a row as prices for many berries remained at low levels. The one exception was Red raspberries where processed prices increased sharply from the low level of 1980, but were still well below the 1979 and 1978 highs. The depressed blackberry market was reflected in the lower production levels as many fields were not picked or only partially picked. Evergreen blackberries accounted for the largest share of the cut-back of blackberry production. Black raspberries yielded well putting total production at the highest level since 1969, although prices continued to decline significantly from the 1979 record highs.

Despite continuous heavy rains which hampered picking during the first half of June, strawberry production was at the highest level since 1972. Acreage continued to increase from the 1978 low after a long 21 year continuous decline. Ash from Mt. St. Helens was not a problem this year as was the case in 1980.

Blueberries continue to be a bright spot in Oregon as acreage continues to increase. Record high temperatures in August resulted in some berry loss. Cranberry acreage is also on an up swing after a steady 5 year reduction as prices reached record highs.

1/ Includes black raspberries.

LIVESTOCK

Approximately one-third of Oregon's agricultural income comes from the production of livestock and livestock products. In 1981 the value of production for all livestock, dairy and poultry was nearly 580 million dollars--up 3 percent from 1980.

Surprisingly, the rise in production value was not based on cattle and calves, which generate over half the livestock value of production each year. While cattle inventory numbers increased 9 percent during 1981, lower prices caused the value of production to fall 4 million dollars from 1980.

Oregon's dairy industry was the major factor in increased livestock value of production. Over 50 million more pounds of milk were produced in 1981 than in 1980. This 4 percent increase in production coupled with higher prices for dairy products boosted their value of production 10 percent in 1981.

Egg production rose from 638 million in 1980 to 665 million in 1981. The average price per dozen also increased from 52.7 cents to 58.8 cents in 1981. Broiler production increased by half a million birds in 1981.

Sheep and lamb inventory numbers increased 8 percent in 1981 to 560,000 head on January 1, 1982. This ranks Oregon 9th in the nation. Wool production was up 7 percent from a year earlier.

The December 1, 1981 inventory of hogs and pigs totaled 78,000 head, down 35 percent from a year ago.
